## ALIGNMENTS

```
transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNAs splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a year oligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries are useful for detecting mRNAs from a coligonucleotide libraries may also be used as specialised mini libraries may also be used as specialised mini libraries to detect transcripts of a sub-transcriptome under a particular biological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect to developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular cates, manna and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format catering from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular WPI; 2004-479808/45. tags to map genes.

Claim 1; SEQ ID NO 9639; 34pp; English.

The invention relates to 17880 cotton expressed sequence tags (ESTB;
ACM45220-ACN63099). The ESTB were isolated from cDNA libraries generated
from primed or non-primed seeds from variety DPSDB, mature seeds from
variety Coker 312 Boswell 96 Field, and androecium tissue,
genes, developing fibres, carpel walls and septa from variety
tissue, developing fibres, carpel walls and septa from variety
Nucctorn33B. The invention also relates to substantially purified
proteins or their fragments encoded by nucleic acid molecules of the
invention, and to transformed plants having a nucleic acid construct
comprising a nucleic acid of the invention. The cotton ESTB are useful a
molecular tags to isolate genetic regions, to isolate genes are
members of a particular gene family. The nucleic acid molecules may be
used for isolating a variety of agronomically significant genes
associated with plant growth, quality, yield, and could also serve as
links in metabolic and catabolic pathways. The nucleic acid molecules are
also useful for identifying genes important in intitating and maintaining
seed germination or that may be used to mitigate stresses encountered
course and cis-regulatory elements which will be useful to express
also useful significant genes in these tissues and/or other tissues,
conductors and cis-regulatory elements which will be useful for
and also permits the acquisition of molecular markers useful in breeding
and also permits the acquisition of molecules are further useful for
detecting the expression level or pattern of a protein or maker
cotton variety Nuccton318 androecular issue parinting. The
present sequence represents a specifically claimed EST isolated from a
cotton variety Nuccton318 androecular issue parinting. The
sequence data for this patent did not form part of the printed
sequence data for this patent did not form part of the printed
sequence the sequence represents a sequince. The parent of the printed
sequence data for this patent did not form part of the printed

```
The invention relates to 17880 cotton expressed sequence tags (ESTs, ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated from primed or non-primed seeds from variety DPSOB, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cotton; plant; EST; expressed sequence tag; transgenic plant; androecium; variety Nucotton33B; library LIB382B; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant quality; plant yield; plant breeding; tissue printing; ss.
                                                                                                                                                                                                                                                                         from the US
and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the sypression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucotton33B androscium tissue cDNA library (LIB3828). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at seqdata.uspto.gov/sequence.html?DocID=US20040123340
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cotton androecium tissue EST Clone ID: LIB3828-012-Q1-N6-A4, SEQ:6000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically aignificant genes associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express as agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The presence are sequence represents a specifically claimed EST isolated from a sequence data for this patent did not form part of the printed from a sequence data for this patent did not form part of the printed from the specification, but was obtained in alectronic format directly from the US patent office at sequence.html?DocID=US20040123340 \$

The present sequence is that of an T50 element found in RNA probes used in examples from the invention. The invention provides a method for screening an agent for its ability to modulate RNA processing. The method comprises (a) contacting the agent with a sample comprising (i) tristetraproline (TIP), TTP-related polypeptide, fragment or variant, (ii) a polyA-preferring 3'-5'-ribo-exonuclease (PARN) polypeptide or its Screening an agent for its ability to modulate RNA processing comprises contacting the agent with a sample comprising tristetraprolin (TTP), a poly(A)-preferring, 3'-5' ribo-exonuclease (PARN) polypeptide and an RNA. Example; SEQ ID NO 35; 94pp; English

active fragment or variant (if the PARN is in a cell, the cell comprises exogenous PARN) and (iii) an RNA which comprises an ARE downstream of a reporter sequence and a 3 polyA tail, where processing of the RNA can be detected, under conditions effective for processing and, optionally, cranslation of the RNA, and (b) detecting processing of the RNA, e.g. by measuring the amount and/or structure of the RNA, deadenylation of the RNA, or binding of the TTP to the ARE. The method can be used to screen for an agent able to inhibit RNA processing for the treatment of a condition mediated by insufficient granulocyte-macrophage colony cimulating factor or for treating frannlocytepenia. It may also be used to screen for an agent able to stimulate RNA processing for treatment of a condition mediated by excess tumour necrosis factor-alpha, an architis (all claimed). The method can be conducted in vitro or in a arthritis (all claimed). The method can be conducted in vitro or in a arthritis (all claimed). The method can be conducted in vitro or in a cell-based format. A high-throughput screening method may be used.

The invention relates to a novel composition comprising a substance that CC modulates the status of 238PLB2, or a molecule that is modulated by modulates the status of 238PLB2, or a mon-human transgenic animal to that produces an antibody; a hybridoma that produces an antibody; a polymucleotide that encodes a peptide; a cytocoxic agent or a cell that expresses 238PLB2; a polymucleotide that encodes a peptide; a cytocoxic agent composition cited above, in the substance composition cited above, in the content of a human unit dosage form, where the substance composition cited above, in coleaves a polymucleotide having 238PLB2 coding sequence or a mucleic acid cleaves a polymucleotide having 238PLB2 coding sequence or a mucleic acid cleaves a polymucleotide having 238PLB2 coding sequence or a mucleic acid specifically recognise a 238PLB2 peptide sequence in the context of a pericular HLA molecule; inhibiting growth of cancer cells that express content of a pericular HLA molecule; inhibiting growth of cancer cells that express concert in an individual. The novel composition has cytostatic activity. The 238PLB2 polymucleotide can be used in gene therapy to treat concert in an individual. The novel composition has cytostatic activity. The 238PLB2 polymucleotide can be used in detecting, preventing, cyaccine. The composition and methods are useful in detecting, preventing, prognosing or treating cancer (e.g. prostate cancer). The genes, proteins or antenpode and produce or a primer, or in changenes. The polymucleotide may be used as a probe or a primer, or in changement mapping. This polymucleotide represents a primer used in the exemplification of the invention.

generic formula, in the 3.5° or 5°.3° direction: (GaTa') a. (GbTb')b'. (GaTa') a'. (GbTb')b'. different from each other; a', b', c', d', e', f', and g' = 0.10, equal or different from each other; a', b', c', d', e', f', and g' = 0.30, equal or different from each other; a', b', c', d', e', f', and g' = 10.6° equal or different from each other; The oligonucleotides are believed to selectively bind and sequenter some proteins which are essential to the viability and growth of tumoural cell line. They have specific and selective cytotoxic activity against tumour cells, and can be used for treating tumours of the liquid type, in particular of lymphoblastic origin, and of solid type, in particular lymphomas. The present phosphodiseter oligonucleotide, at a concentration of 15 micromolar, reduced growth of CRR-CEM tumoural cells and sectable 48

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequencing p812 revealed that the cDNA insert was within the EcoRI and XhoI sites of that plasmid and was directionally correct by out of frame with respect to the beta-galactosidase sequences. To improve the production of galactinol synthase, p821 was modified to place the galactinol synthase sequences in-frame with those of beta-galactosidase. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleotide sequence of galactinol synthase from zucchini and soybean - used to produce plants having altered levels of raffinose saccharide(s)

Cg generic formula in the 3'-5' or 5'-3' direction: (GaTa')a'.-(GbTb')b'.-
CG (GCTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''-(GTGT')g''-N', where: N and CG (GCTc')c''-(GdTd')d''-(GTGT')g''-N', where: N and Gifferent from each other; a', b', c', d', e', f', and g' = 0-10, equal or calfferent from each other; a', b', c', d', e', f', and g' = 1-30, equal or different from each other; The oligonucleotides are believed of company and growth of the special swhich are essential to the viability and growth of tumoural cell line. They have specific and selective cytocoxic activity against tumour cells, and can be used for treating tumours of the liquid type, in particular of lymphoblastic corigin, and of solid type in particular lymphomas. The present phosphodiester oligonucleotide, at a concentration of 15 micromolar, phosphodiester oligonucleotide, at a concentration of 15 micromolar, cells concentration of 15 micromolar, concentration of 15 micromolar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a probe which hybridises to DNA encoding the human F13K regulatory subunit 4, p150 polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; pl50; internucleoside linkage; phosphorothioate linkage; 2'-O-methoxyethyl sugar; 5-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator;

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-3 kinase, regulatory subunit 4, p150. The phosphoinositide-3 kinase, regulatory subunit 4, p150. The coligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide concleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used indiagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory concert, chediak-Higashi syndrome or a metabolic disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Сарв
                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tospovirus resistance; transgenic plant; tomato spotted wilt virus;
Impatiens necrotic spot virus; TSWV; ss.

two binding moleties having specificity for different binding sites on the same target. (C) is useful for treating euplastic tumour growth and disease associated with angiogenesis or hyperproliferation (claimed). (C) is useful for treating diseases such as arthritis, atherosclerotic plaques, corneal graft neovascularization or ocular diseases. (C) is small and can more easily reach a target. (C) localizes more effectively to the target site than other targeting compounds due to its binding to more than one site on the same target. This sequence represents a DNA oligonucleotide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a multivalent compound (C) comprising at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Multivalent compounds with at least two binding moities having specificity for different binding sites on the same target, useful for treating and diagnosing, e.g. angiogenic and hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; deposition unit misalignment; polymeric array synthesis; pulse jet misalignment; printhead misalignment; microarray.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                    The invention relates to a method of detection of deposition unit misalignment of an in situ polymeric array synthesis device which comprises synthesising test probe feature(s) on substrate using in situ polymeric array synthesis device, contacting test probe feature with at least two different distinguishably labelled targets and evaluating binding of labelled targets to test probe feature to detect any pulse jet misalignment of polymeric array synthesis device. The method is useful for detecting deposition unit misalignment e.g. printhead misalignment, of an in situ polymeric, e.g. mucleic acid, array synthesis device. The method is easy to use, cost effective. effective at detecting printhead misalignments and may enable immediate detection and/or adjustments of one or more printheads of an in situ nucleic acid array synthesis fluid deposition device if misalignment is detected. The present sequence represents an oligonucleotide synthesised on a microarray.
                                                                                                                                                    Detection of deposition unit misalignment of in situ polymeric array synthesis device, by contacting test probe feature with different distinguishably labeled targets, and evaluating binding of labeled

                                                                                                                                                                        The invention relates to a method of detection of deposition unit misalignment of an in situ polymeric array synthesis device which comprises synthesis device, oncacting test probe feature(s) on substrate using in situ polymeric array synthesis device, contacting test probe feature with at least two different distinguishably labelled targets and evaluating binding of labelled targets to test probe feature to detect any pulse jet misalignment of polymeric array synthesis device. The method is useful for detecting deposition unit misalignment e.g. printhead misalignment, of an in situ polymeric, e.g. nucleic acid, array synthesis device. The method is easy to use, cost effective effective at detecting printhead misalignments and may enable immediate detection and/or adjustments of one or more printheads of an in situ nucleic acid array synthesis fluid deposition device if misalignment is detected. The present sequence represents an oligonucleotide synthesised on a microarray.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primers MB2 (AAT68809) and MB3 (AAT68810) are based on the nucleotide sequences for the Bacillus amyloliquefaciens sacB gene and the polylinker region of pBES04. MB3 overlaps Arg codon 331 of the sacB(BamP) W29 mutant gene (see also AAT68806) and was designed to convert codon 331 into a Leu codon in the amplified DNA. The primers were used to amplify a region of plasmid pMGB161delcat1 that included the 473 bp between the B88HII and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Positive selection for transformed Gram positive bacteria, especially Bacillus - useful for cloning heterologous genes encoding e.g. industrial enzymes, immunoglobulin(8), etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gram-positive bacterium; positive selection vector; levansucrase; Bacillus amyloliquefaciens; signal peptide cleavage; sacB(BamP)W29; primer; PCR; polymerase chain reaction; ss.
distinguishably labeled targets, and evaluating binding of labeled targets to test probe feature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

BamHI restriction sites. The mutation showed that the polymerase activity of the sacB(BamP)W29 gene product is necessary for inhibition of growth on medium with sucrose by sacB(BamP)W29. Inactivation of sacB(BamP)W29 could be used to select for growth of colonies of B. subtilis with cloned

                                                                                                                                                                                           셤
```

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Checklak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PCR primer used to amplify DNA encoding the human PI3K

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 July 1 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypebide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metal for modulating or treating hyperproliferative disorders and modified may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PCR primer used to amplify DNA encoding the human P13K regulatory subunit 4, p150 polypeptide of the invention.

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphornositide. Stranse, regulatory subunit 4, pls0. The oligonucleotides comprises at least one modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to treat a disease or condition associated with phosphoinositide-3-kinase, regulatory cabunit 4, pls0, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used

This invention describes a novel antisense oligonucleotides which specifically hybridises to and inhibits the expression of human phosphoinositide-1-kinase, regulatory subunit 4, p150. The phosphoinositide at least one modified internucleoside linkage, oligonucleotides comprises at least to modified internucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide can be used in diagnostics and as research reagents and kits. It can also be used prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. It can also be used to creat a disease or condition associated with phosphoinositide-3-kinase, regulatory cubenit 4, p150, e.g. hyperproliferative disorder, preferably cancer, chediak-Higashi syndrome or a metabolic disorder. The products of the invention are immunomodulators with cytostatic activity and can be used
                                                                                                                                                                                                                                                                                      antisense; inhibitor; hybridisation; human; phosphoinositide-3-kinase; regulatory subunit 4; p150; internucleoside linkage; phosphorchioare linkage; 2'-O-methoxyethyl sugar; S-methylcytosine; infection; inflammation; tumour formation; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; metabolic disorder; immunomodulator; cytostatic; gene therapy; ss; primer; PCR.
                                                                                                                                                                                                                                                  Human phosphoinositide-3-kinase regulator subunit 4 p150 PCR primer 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compound targeted to a nucleic acid molecule encoding phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for treating cancer, Chediak-Higashi syndrome or a metabolic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô

```
PCR primers AAV03153-54 were used to amplify a terminator region of the PR-la gene from tobacco. This fragment was used to create a a recombinant gene in which a gene encoding an anti-bacterial peptide (e.g. sarcotoxin la) is bound to a plant gene via a hinge region of tobacco chitinase, an expression cassette in which the recombinant gene is bound to a plant promoter, and a gene having the expression cassette and a drug resistance gene linked to a plant promoter which is constitutively expressed. Plants transformed with this expression vector are resistant to pathogenic fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plant resistant to pathogenic fungi and bacteria - especially containing insect gene encoding sarcotoxin la.

The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of a marker gene in the cell, where the expression level of the marker gene useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Caenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining if a gene product/compound is involved in preventing replication error in a cell, useful for treating cancer, comprises determining expression level of a marker gene in a cell treated with gene product inhibitor/compound.

                                                                                                                                                                                                                                                                                                                              The present invention describes a pair of parent plants for producing seeds comprising: (a) a first parent plant containing at least 1 gene seeds comprising: (b) a second parent plant containing at least 1 gene sequence encoding a polypeptide or protein B; where the polypeptides A and B, when expressed in separate plant containing at least 1 gene sequence encoding a polypeptide or protein B; where the polypeptides A and B, when expressed in separate plants, do not form an active enzyme, a regulatory protein or protein which affects the structural integrity of a cell, but when expressed in the same plant do form an active enzyme, regulatory protein, or protein which affects the structural integrity of a cell. Also described is a method for producing a plant having a desired phenotype by virtue of an active enzyme, a regulatory protein or a protein which affects the structural integrity of a cell. Comprising crossing a first line with a second line where the first line contains one or more gene sequences encoding a polypeptide or protein. A but which line does not have the desired phenotype and where
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the second line contains one or more gene sequences encoding a polypeptide or protein B which is complementary to the polypeptide or protein A but which line does not have the desired phenotype. The method can be used for producing plants having altered phenotypes, e.g. malesterility, embryoless seeds, altered biochemical (e.g. fatty acid) composition or herbicide resistance. The present sequence represents an inverse PCR (IPCR) primer which is used in an example from the present
                                                                                                                                                                                          Production of transgenic plants having a desired phenotype - by using a pair of parent plants which each produce a polypeptide which complement

The Invention retailed to American and a method for the recombinant production of GM2 activation protein 14. The protein has a molecular weight of 14 MD. The present inventionally discloses an antagonist of GM2 activation protein 14 for therapeutic use, and an antibody which specifically binds to GM2 activation protein 14 for therapeutic use, and an antibody which specifically binds to GM2 activation protein 14. GM2 activation protein 14, and nucleotides which encode it may be used for treating a variety of disease, which small an antignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders, inflammatory conditions, familial crectingm, embryonic and developmental disorders, and nervous system disorders. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic coid amplification reactions or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences ABA02434-ABA02435 corrections or as a probe protein and an antibution-pCR (RT-PCR) primers used in an antibution property or activation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                exemplification of the invention to isolate human GM2 activation protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, molecular chaperone cpn60 protein 14; chaperone; tumour;

                                                                                                                                                  셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human zinc finger protein 12.54 (ABPSB744) and nucleic acids encoding it (ABZS7353). The protein has a molecular weight of 12.54 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Zinc finger protein, 12.54 can be used in the treatment of a variety of diseases such
                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polypeptide-human zinc finger protein 12.54 and polynucleotide for coding
                                         New polypeptide human chapronin CPN 60 protein 14 and polynucleotides for encoding same.
                                                                                                   The invention relates to human molecular chaperone cpn60 protein 14, polynucleotide encoding for this polypeptide and a method for producing this polypeptide by using DNA recombinant techniques. The invention also discloses the method for curing several diseases, such as malignant tumour, haemopathy, HIV infection, immunological disease and various inflammations by using the polypeptide. The invention also discloses an antagonist for resisting said polypeptide and its therapeutic action and the application of polynucleotide encoding this novel human molecular chaperone cpn60 protein 14. The present sequence is that of a human molecular chaperone cpn60 protein 14 PCR primer, useful in examples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; zinc finger protein 12.54; recombinant production; gene therapy; cancer; tumour; human immunodeficiency virus; HIV infection; cytostatic; reverse transcription-PCR; RT-PCR; primer; 8s.

The present invention relates to a method for determining if a gene product or compound is involved in preventing replication error in a cell. The method involves providing a cell with a specific inhibitor for a gene product or with a compound and determining the expression level of a marker gene in the cell, where the expression level of the marker gene is dependent on the occurrence of a replication error. The invention is useful in gene therapy and for treating a subject having tumours or cancer. The present sequence is a Gaenorhabditis elegans heat-shock promoter DNA. This sequence is used to illustrate the method of invention.
                                                                                                                                                                                                                                                 ö

This invention relates to novel mutant serum paraoxonase (PONI) nucleic acid molecules and the encoded proteins thereof. Specifically, it refers to enzymes that are calcium dependent phosphotriseterases essential to the detoxification process of orapportisephotriseterases essential to praoxon and the nerve agents arrin and soman. The present invention describes a method to identify mutated PONs that exhibit substantially identical (or improved) substrate specificity in comparison with the wild type PON and also those mutants that do not form aggregates when expressed in bacteria. In particular, the method employed an in vitro expressed in bacteria. In particular, and maintaining substrate binding. These mutants have been found to be useful for treating or preventing PONI-related diseases including hyperlipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               atherosclerosis, neurological disease (e.g. Alzheimer's disease, neurofibromatosis, Huntington's disease, depression, amyotrophic lateral sclerosis, multiple sclerosis, stroke, parkinson's disease or multipliated and an organophosphate poisoning. Accordingly, they exhibit antilipaemic, antiarteriosclerotic, neuroprotective, notropic, cytostatic, anticonvulsant, antidepressant and antiparkinsonian activities, as well as being an antidote in a case of poisoning. This oligonucleotide sequence is a PCR primer used for the

The present invention provides the protein and coding sequences of the Zea mays ZmWADS2 protein, which is specifically expressed in pollen. The sequences can be used to produce male sterile plants, as ZmWADS2 is essential for pollen tube growth. These are useful in hybrid breeding, particularly of corn, cereal and grain. The present sequence is a PCR primer for the ZmWADS2 coding sequence
    Male sterile plant; maize; hybrid breeding; pollen tube; ZmMADS2; grain; cereal; corn; PCR primer; s8.
                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acid molecule, ZmMADS2 derived from pollen of Zea mays useful for cloning and expressing a pollen specific sequence in a plant and for producing male sterile plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methoxyethyl sugar sorder; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to regulatory elements (AAF76067) from the maize MADS box gene ZmwADS2 (AAF76068) which are capable of directing capression in a pollen-specific manner. The ZmwADS2 protein (AAB73333) is expression in a pollen-specific manner. The ZmwADS2 protein (AAB73333) is expressed particularly in mature pollen after dehiscence, indicating that it has an essential role in pollen development and function, in particular in pollen tube growth. The invention also relates to vectors particular in pollen tube growth. The invention also relates to vectors and host cells comprising the ZmwADS2 regulatory or genomic sequence, and host cells comprising the ZmwADS2 regulatory or generation of transgenic plants. The ZmwADS2 regulatory sequences are useful for cloning and expressing a pollen-specific or pollen-abundant gene in a plant, and may also be useful for isolating related comprisation of agene of interest in a pollen-specific or pollen-preferred manner. The ZmwADS2 regulatory sequences are useful for isolating related regulatory sequences of other plant species which confer pollen or group confer pollen or group conference of interest operably linked to them. The regulatory sequences are useful in plant breeding, especially for the production of hybrid seed. In particular, they may be used to drive the pollen-specific compression of heterologous genes which confer nuclear or cytoplasmic male steility in transgenic plants (e.g., cereals). Sequences AAF76081.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic acid molecule useful for cloning and expressing a pollen
                                                                                                             pBluescript vector PCR primer, SEQ ID:26, used to isolate ZmMADS2 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar modiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar modiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #34.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                                       New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; immunomodulator; neurodegenerative; antimicrobial;

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating byperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

                                The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically thybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders (i.e. and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #58.
                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ss; antisense oligomucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methoxyethyl sugar moiety; 5-methoxyethyl sugar moiety; cancer; Chediak-Higashi syndrome; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; ceurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified
hybridises with a nucleic acid molecule encoding PIJK regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising a 5-methylcytosine. The antisense compounds are and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders and alaquostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #64.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e a phosphorothioate linkage, at least one modified internucleoside linkage i.e a phosphorothioate linkage, at least one modified super moiety, preferably a 2'-0-methoxyethy! sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics
nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PINK regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #74

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense olisyonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense olisyonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified comprises and for preferably a 1'-0-methyloytosine. The antisense compounds are uncleobase comprising a 5-methyloytosine. The antisense compounds are uncleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders (i.e. cancer), chedriak-Higashi syndorme, neurodegenerative disorders and and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hypotidises with a nucleic acid molecule encoding P13K regulatory subunit 6, proficial end inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, i.e. a phosphorothicate linkage, at least one modified sugar moiety, or at least one modified nucleobase comprising a 5-methylotrosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or dalaying infection or inflammation. This sequence
                                                                                                                                                                                                                                          Human PI3K regulatory subunit 4, pl50 DNA antisense oligonucleotide #6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                   Human, phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methoxyethyl syndrome; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-1-kinase (PT3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PT3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense coligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified in cucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PT3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                       Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #26.
                                                                                                                                                   Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 Kinase; ss; antisense oligonuclectide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.4%; Score 20; DB 1; Length 20;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably 2'-0-methoxyethyl sugar molety, or at least one modified in nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higsshi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or infilammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides inhibiting the expression of bhosphoinositide-31-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #73.
                              PI3 kinase; ss; antisense oligonucleotide; phosphorothicate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioart linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer). Chediak Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #77.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides inhibiting the expression of phosphoinositide-3 kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage oligonuclectide comprises at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P118k; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                    New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human PI3K regulatory subunit 4, p150 DNA target region #11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.4%; Score 20; DB 1; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinosttide-1-kinase (PT3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense comparises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleothioate linkage at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleothio comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and etabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; phosphoinositide-3-kinase regulatory subunit 4; p150; p13K; p13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.

                                                                                                                                                                                             concoding human phosphoinositide—3 kinase (Pi3K) regulatory subunit 4, pl50. The compound is an antisense oligonucleotide that specifically pl50. The compound is an antisense oligonucleotide that specifically hybridises with a mucleic acid molecule encoding Pi3K regulatory subunit 4, pl50 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothibate linkage, at least one modified sugar molety, preferably a 2'-0-methoxyethyl sugar molety, or at least one modified nucleobase comprising the expression of F13K regulatory subunit 4, pl50 nucleobase comprising the expression of F13K regulatory subunit 4, pl50 cancer). Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, pl50 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; phosphoinositide-3-kinase regulatory subunit 4; p150; PI3K; PI3 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moietry; 5-methoxyetosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                   New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 17 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified custom custom in a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Checiak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or infilammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methyloyrosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human PI3K regulatory subunit 4, p150 DNA target region #44.

                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and and for preventing or treating hyperproliferative disorders and mod in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense cities represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; phosphoinositide-3-kinase regulatory subunit 4; p150; p11K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, pl50, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                           °
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human PI3K regulatory subunit 4, p150 DNA target region #58.
                                                                                                                                                                                                                                                                                                                                                           0.4%; Score 20; DB 1; Length 20;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably 2'-0-methoxyethyl sugar molety, or at least one modified sugar motety, nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperpoliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostide-3-kinase (PT3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methyloyrosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically thybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #60.
4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-metholycycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, cancoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, b150. The compound is an antisense oligomucleotide that specifically can incleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligomucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, or at least one modified preferably a 2-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are nucleobase comprising the expression of P13K regulatory subunit 4, p150 useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                               ö
for modulating the expression of PI3K regulatory subunit 4, p150
                                                                 diagnostics
                   and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research addiagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-1-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar modety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar modety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified of sugar modety, or at least one modified sugar moiety, or at least one modified of modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.

Sequence 20 BP; 8 A; 3 C; 2 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-o-methoxyethyl sugar molety, or at least one modified
                                                                                                                                                                                                                                                                                                         Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (1.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer), Chedlak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonuclectide of the invention.

Human P13K regulatory subunit 4, p150 DNA antisense oligonucleotide #72.

(first entry)

11-MAR-2004

ADH26747;

ADH26747 standard; DNA; 20 BP.

Human, phosphoinositide-3-kinase regulatory subunit 4, p150; P13K; p13 kinase; ss. antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-metholychosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

antiinflammatory.

US2003225013-A1.

Example 15; SEQ ID NO 82; 62pp; English.

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically tybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), chediak-Higashi syndrome, neurodegenerative disorders and entabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence is represents an antisense oligonucleotide of the invention.
```

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, pls0. The compound is an antisense oligonucleotide that specifically the compound is an antisense oligonucleotide that specifically the pls0 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising the expression of FI3K regulatory subunit 4, pls0 and for preventing or treating byperproliferative disorders (i.e. cancer), chediak-Higashi syndrome, neurodegenerative disorders and cancer), chediak-Higashi syndrome, neurodegenerative disorders and in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified in nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperpoliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a F13K regulatory subunit 4, p150 DNA antisense
Human, phosphoinositide-1-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxytethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 Kinase; ds; antisense oligonucleocide; phosphorothioate linkage; 2.-0-methoxyethyl sugar moiety; 5-methyloytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                      cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human PI3K regulatory Bubunit 4, p150 DNA target region #37.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 5 A; 6 C; 5 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, or at least one modified nucleobase comprising a 5-methylotrosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer), Chedlak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and disgnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; phosphoinositide-3-kinase regulatory subunit 4; p150; p13K; p13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; inmicrobial; antinilammatory.

```
The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleocide that specifically hypothess with a nucleic acid molecule encoding PI3K regulatory subunit hypothess with a nucleic acid molecule encoding PI3K regulatory subunit hypothess with a nucleic acid molecule encoding PI3K regulatory subunit coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are uncleobase comprising the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer). Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antieense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methyloytosine; hypexproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytosteatic; immunomodulator; neurodegenerative; immunomodulator; neurodegenerative; antimicrobial; antiinflammatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                   The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide--kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleotheose comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancers), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human PI3K regulatory subunit 4, pl50 DNA antisense oligonucleotide #32.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding Pi3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified supar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (1.e.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #48.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence

                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                   ð
                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                       The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit by pridises with a nucleic acid molecule encoding PI3K regulatory subunit oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 useful for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #52.
                                                                                                                                                                                                                                                                     cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylycycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule cending human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, pls0. The compound is an antisense oligonucleotide that specifically cc 4, pis0 and inhibite expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified sugar moiety, i.e. a phosphorothioate linkage, at least one modified sugar moiety, or at least one modified cross moiety, or at least one modified or preferably a 2'-0-methoxychtyl sugar moiety, or at least one modified custing the expression of PI3K regulatory subunit 4, pls0 useful for modulating the expression of PI3K regulatory subunit 4, pls0 cancer, cancer, thigashi syndrome, neurodegenerative disorders and cancers. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a compound targeted to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #57.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-metholycycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, pl50. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, pl50 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i. e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl squar moiety, or at least one modified nucleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, pl50 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar molety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PISK) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PISK regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified unscleobase comprising a 5-methyloytosine. The antisense compounds are useful for modulating the expression of PISK regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (1.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #69.
i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified uncleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; phosphoinositide-3-kinase regulatory subunit 4; p150; p13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorder; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modilating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                         ö
                   metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                         Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 p150. The compound is an antisense oligonucleotide that specifically phyridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modilating the expression of F13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified in nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or infilammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                 Human, phosphoinositide-1-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chedlak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-Kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide 3-kinase (FI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hydridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypebide. The antisense 4 p150 and inhibits expression of the polypebide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothibate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer). Chediak-Higashi syndrome, neurodegenerative disorders and cancer, cancer and in preventing or treating hyperproliferative disorders and modified in preventing or delaying infection or inflammation. This sequence represents a P13K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically thy in the antisense at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage oligonucleotide comprises at least one modified internucleoside linkage preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders and cancebolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence and in prevents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonuclectide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypoptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    i.e. a phosphorothicate linkage, at least one modified sugar moterly, preferably a 2'-O-methoxyethyl sugar motery, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense oligomucleotide target region of the invention.
              Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gape

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense coligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified augar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified in uncleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #28.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150 The compound is an antisense oligonucleotide that specifically the inventigues with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. cancer), checklak-Higashi syndrome, neurodegenerative disorders and end in preventing or delaying infection or inflammation. This sequence and in preventing or delaying infection or inflammation. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #40.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-1-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are nucleobase comprising the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e. and for preventing or treating hyperproliferative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence and in preventing or allogonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human PI3K regulatory subunit 4, p150 DNA antisense oligonucleotide #41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; phosphoinositide-3-kinase regulatory subunit 4; p150; p13K; p13 kinase; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-metholycycosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                 New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                      The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinostiide-3-kinase (P13K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding P13K regulatory subunit 4, p150 and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, or at least one modified nucleobase comprising a 5-methylytrosine. The antisense compounds are useful for modulating the expression of P13K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders (i.e.
                                                                                                                                                                                                                                                                                                                                                         cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and diagnostics and in preventing or delaying infection or inflammation. This sequence represents an antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; phosphoinositide-3-kinase regulatory subunit 4; p150; P13K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation; cytostatic; immunomodulator; neurodegenerative; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                   New antisense oligonucleotides inhibiting the expression of phosphoinositide-1-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human PI3K regulatory subunit 4, p150 DNA target region #18.

The invention relates to a compound targeted to a nucleic acid molecule encoding human phosphoinositide-3-kinase (PI3K) regulatory subunit 4, p150. The compound is an antisense oligonucleotide that specifically hybridises with a nucleic acid molecule encoding PI3K regulatory subunit 6, p150 and inhibits expression of the polypeptide. The antisense conjouncleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar molety, preferably a 2'-O-methoxyethyl sugar molety, or at least one modified in nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of PI3K regulatory subunit 4, p150 and for preventing or treating hyperproliferative disorders and cancer), Chediak-Higashi syndrome, neurodegenerative disorders and metabolic disorders. These may also be used in research and disgnostics and in preventing or delaying infection or inflammation. This sequence represents a PI3K regulatory subunit 4, p150 DNA antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, phosphoinositide-1-kinase regulatory subunit 4; p150; P11K; P13 kinase; ds; antisense oligonucleotide; phosphorothioate linkage; 2'-O-methoyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; Chediak-Higashi syndrome; neurodegenerative disorder; metabolic disorders; inflammation;
New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides inhibiting the expression of phosphoinositide-3-kinase, regulatory subunit 4, p150, useful for preventing or treating diseases associated with the subunit, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; immunomodulator; neurodegenerative; antimicrobial
